

Agenda

→ Monolithic vs Microservices

→ What are API's

→ REST

→ Stateful vs Stateless API's

→ MVC architecture

→ Login & SignUP API's

→ How Payment infrastructure works

→ Implementing Payments API

Ecommerce.

⇒ Outcome :

Microservices based working Project in your resume with lot of advanced concepts.

100M.

①

⇒ Bottleneck

Slowest part of your system.

waiting time ↑

② SPOF. ⇒ Single Point of failure.

⇒ If this m/c goes then complete YT will go down.

Flipkart. (2008). (10-20 orders/day)

Sachin

⇒ 1 server to serve the traffic.

2010. ⇒ 1000 orders/day

⇒ Increase the capacity of m/c.

2012.

10000 orders/day

⇒ SPOF.

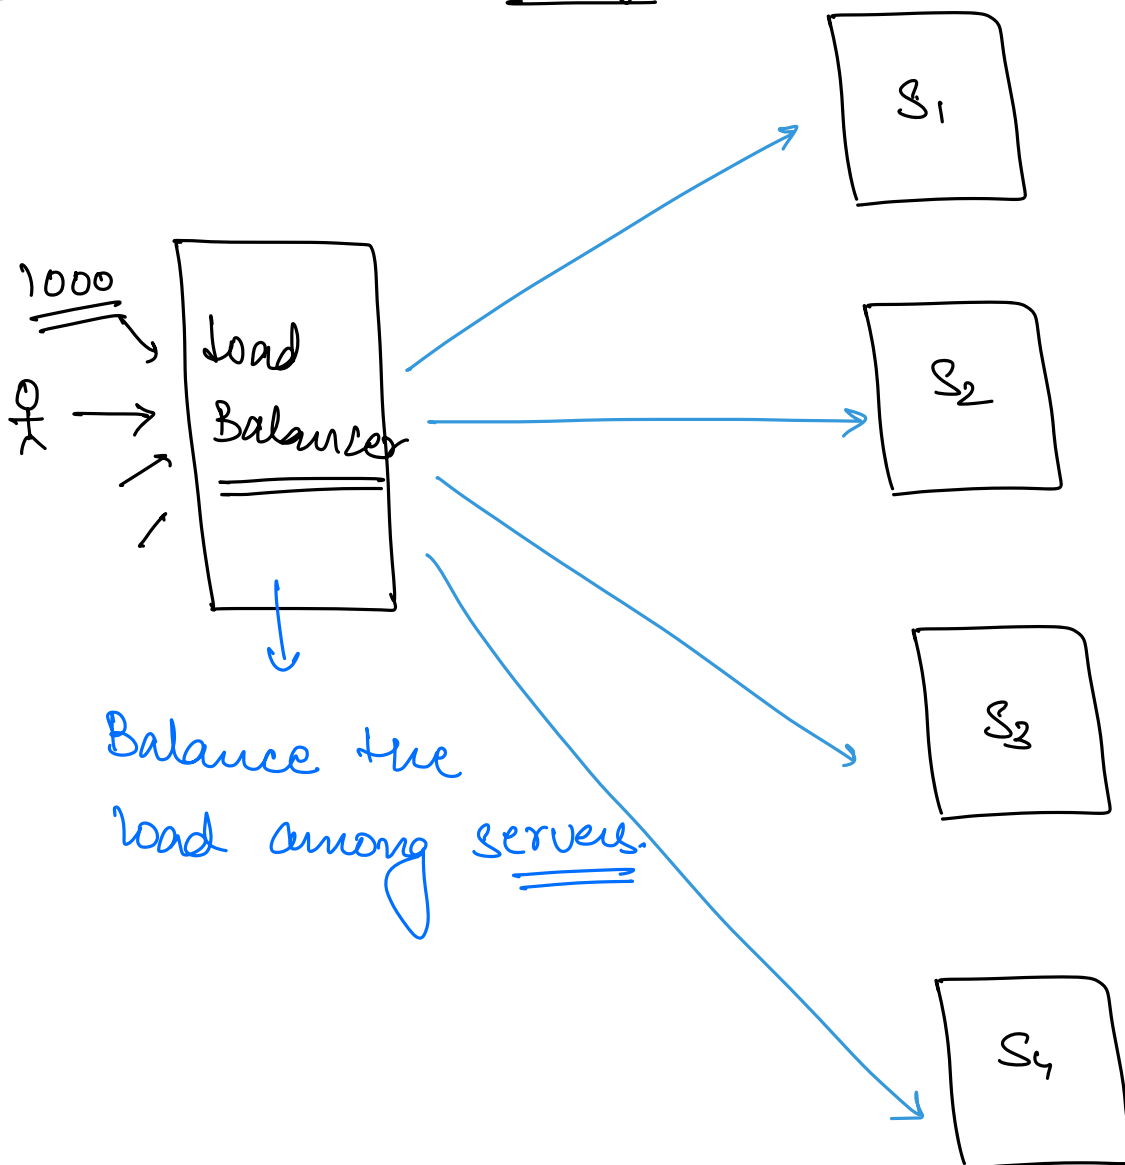

⇒ Can we increase the capacity of a single m/c infinitely. ⇒ NO.

⇒ Vertical Scaling: Increasing the capacity of some m/c
↳ has some limitation.

⇒ Solⁿ: Add more machines.

NO SPOF

2015: 200,000 order/days.

Horizontal Scaling

⇒ Keep on adding more & more m/c to the infra as required.

⇒ Flipkart / Amazon

→ ProductService

→ UserService

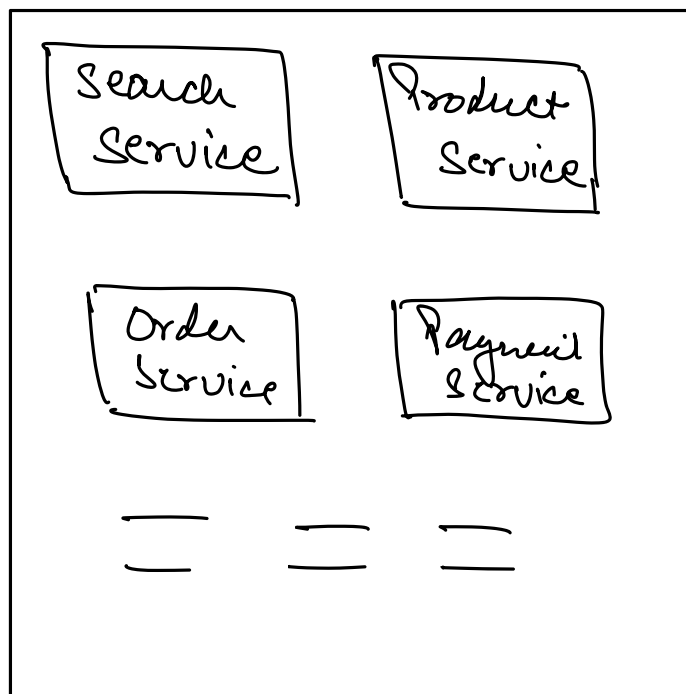

→ SearchService

→ OrderService

→ PaymentService

→ Cart Service

→

⇒ Monolithic.

SSec

No SPOF.

⇒ Our complete App is running on each m/c.

Consistent Hashing

Algorithm

⇒ MONOLITHIC.

Single Project with all the functionalities

⇒ Monolithic: When complete software application running on each machine.

Cons of Monolithic.

- 1) No selective scaling
- 2) No tech stack flexibility.
- 3) High Deployment time
- 4) A small bug can make the entire Appⁿ down.

PaymentService \Rightarrow 2 m/c
OrderService \Rightarrow 3 m/c
SearchService \Rightarrow 10 m/c

Pros.

- 1) Single Deployment.
- 2) No n/w call, low latency.

\Rightarrow MICROSERVICE.

Each service is an individual Project

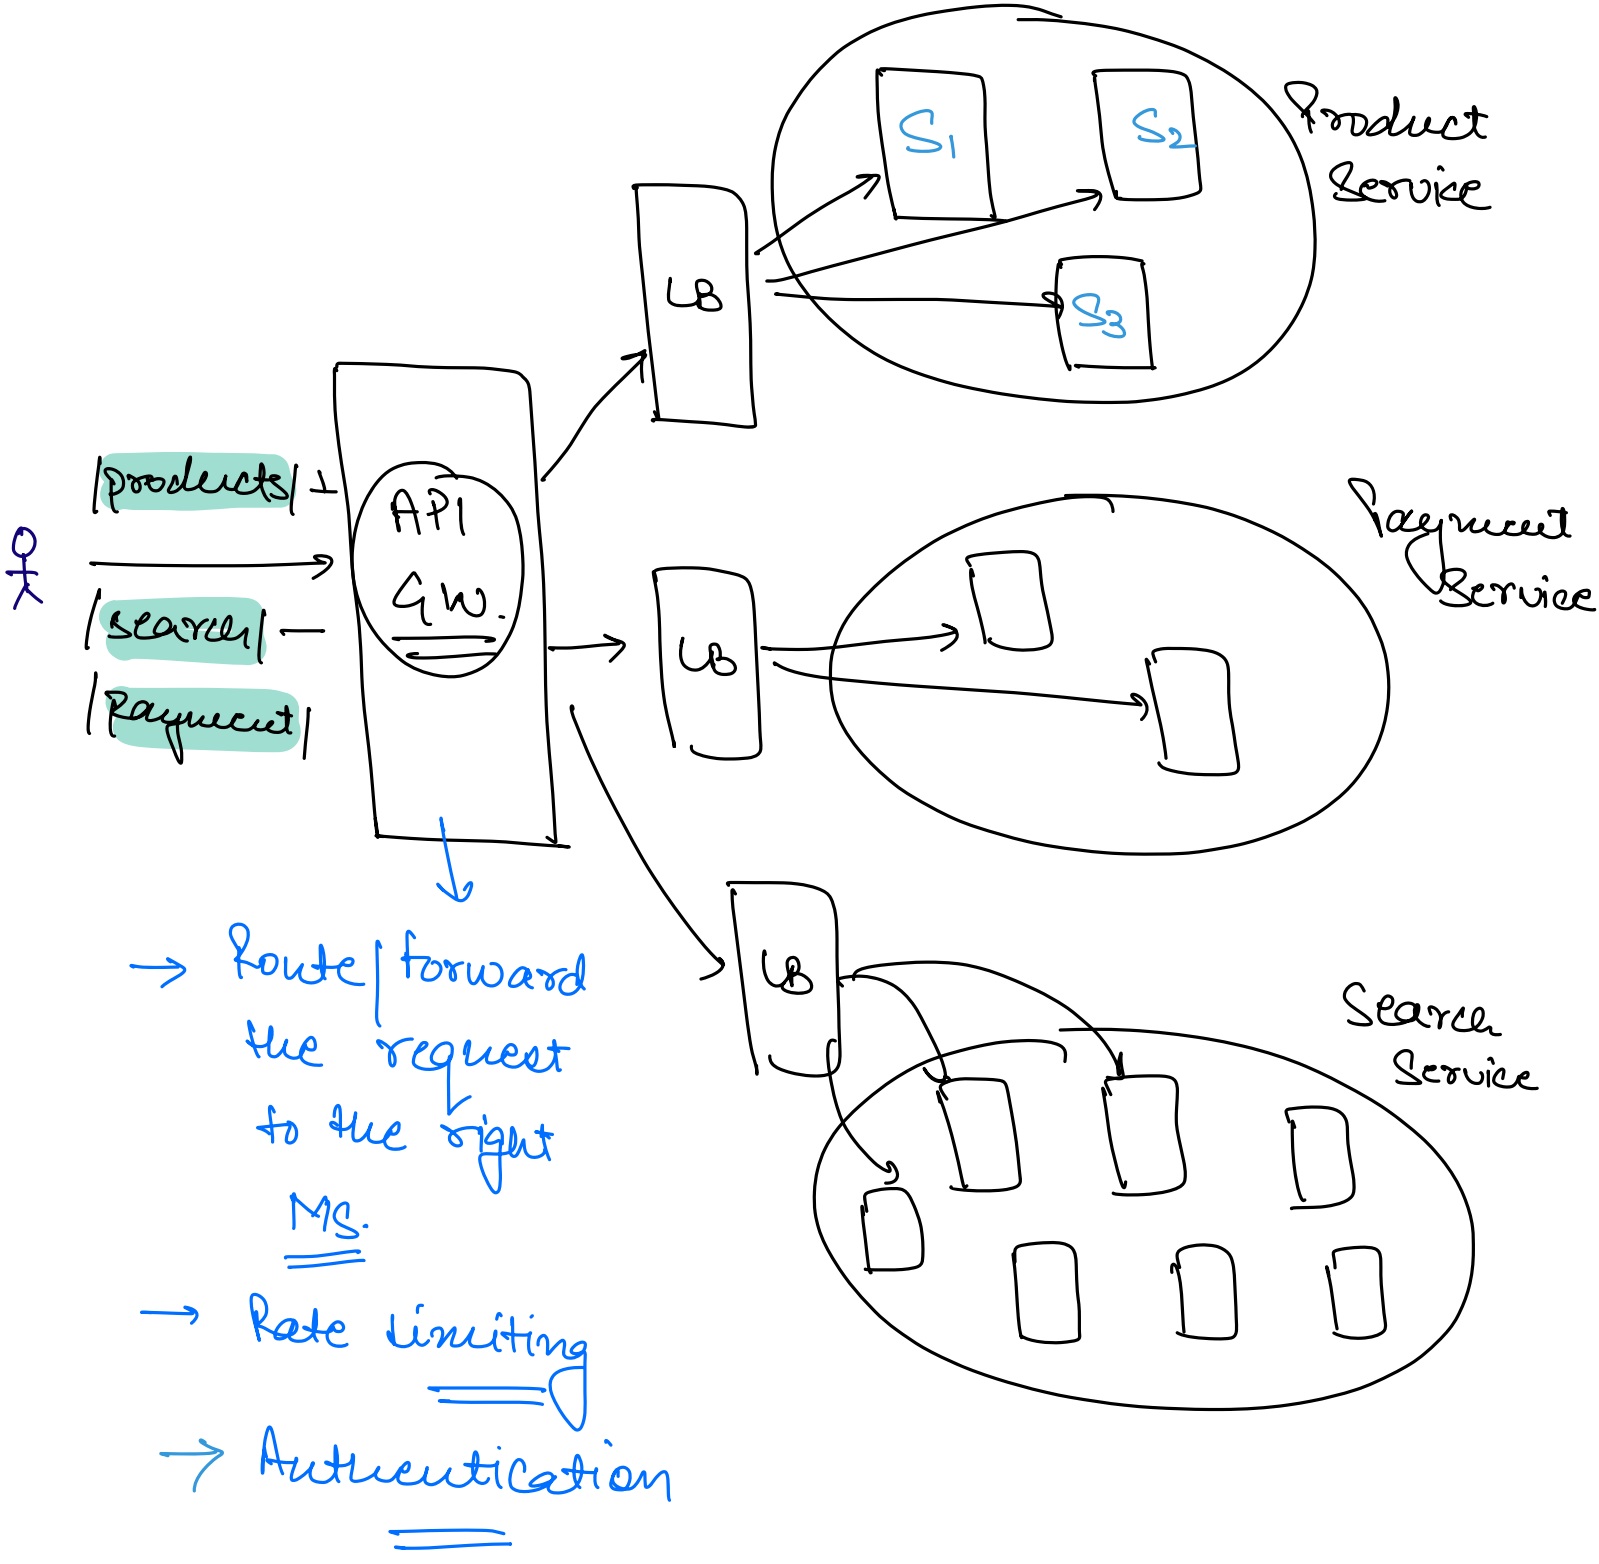

Microservice : When the Big system is broken down into individual services. & each service runs individually.

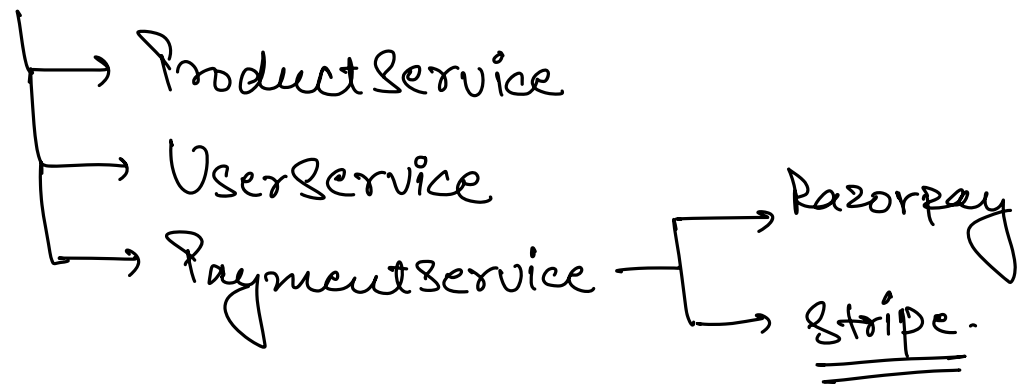

⇒ SAP : Single Responsibility Principle

Microservices : Each service should have a single responsibility.

⇒ MICROSERVICES.

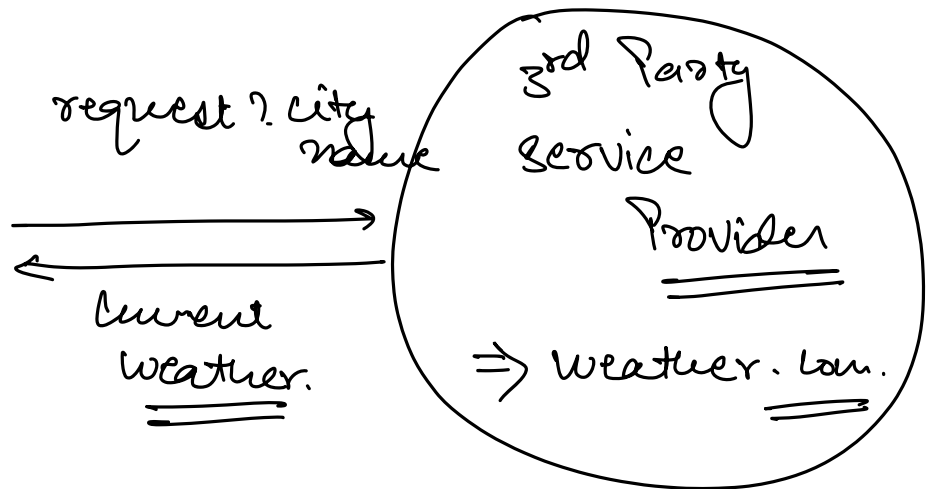

JAVA + SpringBoot.

API's.

↳ Application Programming Interface.

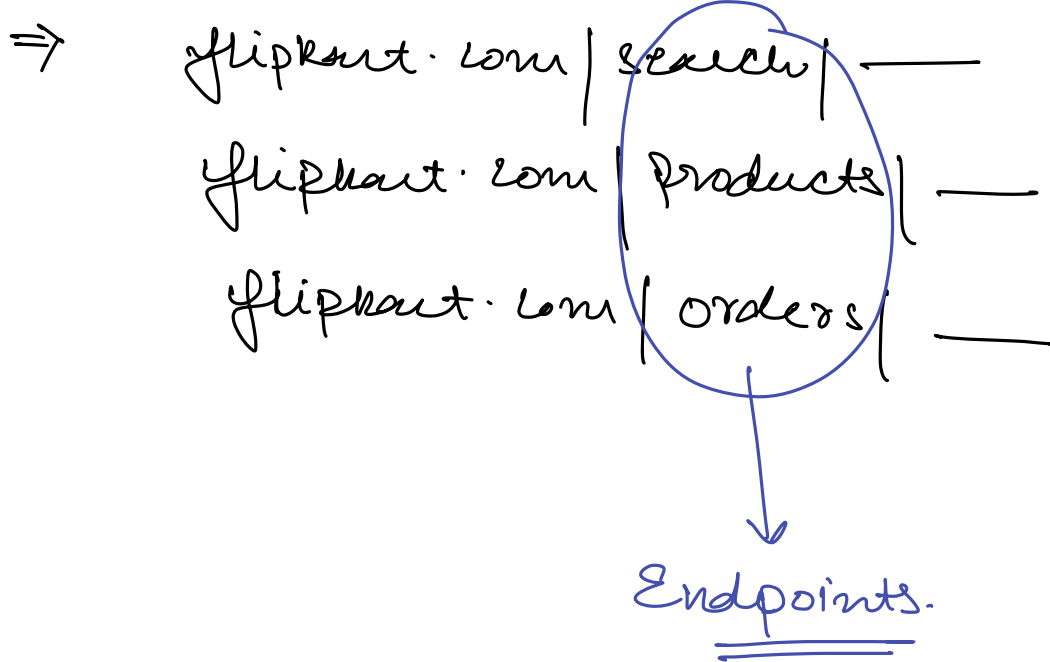

Contract

1 \$ | Api call.

⇒ API: functionalities provided by companies to fetch data.

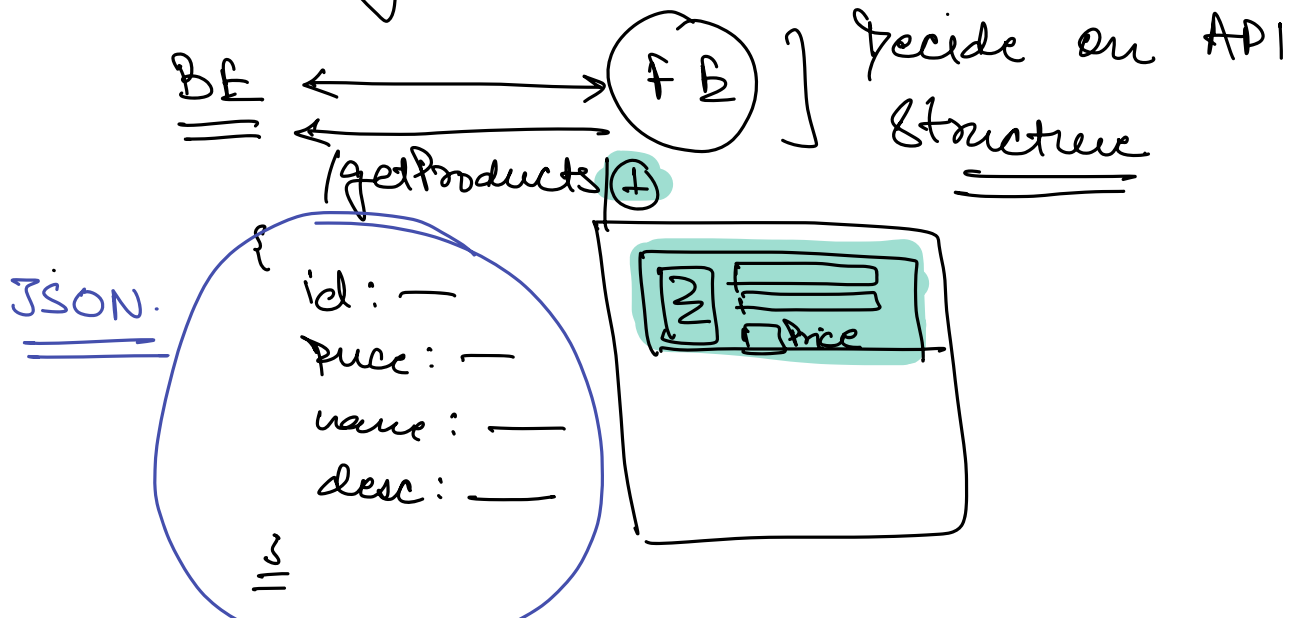

⇒ API: Set of Methods | URL's | endpoints | functionality provided by the application in order to interact with the data.

(get | update | create | delete) ⇒ CRUD

↓
read

⇒ Functionality

JSON Object

```
{ "id": 1,  
  "title": " Fits 15 Laptops",  
  "price": 109.95,  
  "description": "Your perfect pack for everyday use and walks in the forest."  
}
```

12:15 PM.
